

# 12v agm solar batteries deep cycle charge percentage

What is the voltage of a 12V AGM deep cycle battery?

As you can see, the voltage of a 12V AGM deep cycle battery ranges from 13.00V to 10.50V. Example of how to use this chart: Let's say that you measure the voltage on the 12V AGM battery; it reads 12.10V. That means that the battery still has between 50% and 60% charge (55%, to be exact). This is true for all 12V AGM deep cycle batteries.

Why is charge voltage important for a deep cycle AGM battery?

Charge voltage is a critical factor in managing the health and performance of your deep cycle AGM battery. Essentially, the charge voltage indicates how much power is being sent into the battery during the charging process.

What is a 48V deep cycle AGM battery?

A 48V deep cycle AGM battery has a voltage range of 52.00V at 100% charge to 42.00V at 0% charge. This means a full battery has a 10.00V absolute voltage difference from an empty battery.

What is the voltage difference between 12V and 24V AGM batteries?

This is true for all 12V AGM deep cycle batteries. Here is the 24V AGM battery voltage chart as well: With this higher voltage 24V deep cycle battery, the voltage ranges from 26.00V at 100% charge to 21.00V at 0% charge; the absolute voltage difference between a full and an empty battery is 5.00V.

What is the state of charge voltage range for a 12V AGM battery?

A 12V AGM battery's state of charge voltage ranges from 13.0V at 100% capacity to 10.50V at 0% capacity. When seen in the context of the 12V AGM battery voltage chart, this range helps determine the battery's state of charge.

Do all AGM batteries have the same voltage discharge curve?

Because all AGM batteries have the same voltage discharge curve. That's why we can use the voltage state of charge (SOC) charts to determine how much juice is left in the AGM battery just by measuring the voltage, and consulting the voltage discharge chart.
