Can a lithium ion battery cause a gas explosion in energy storage station?

The numerical study on gas explosion of energy storage station are carried out. Lithium-ion battery is widely used in the field of energy storage currently. However, the combustible gases produced by the batteries during thermal runaway process may lead to explosions in energy storage station.

What causes large-scale lithium-ion energy storage battery fires?

Conclusions Several large-scale lithium-ion energy storage battery fire incidents have involved explosions. The large explosion incidents, in which battery system enclosures are damaged, are due to the deflagration of accumulated flammable gases generated during cell thermal runaways within one or more modules.

How is combustion rate distributed in energy storage container during explosion?

Variation process of combustion rate in energy storage container during explosion. Due to the numerous battery modules installed in the container, the flame was limited in the middle aisle and on the top of the container. Fig. 7 a showed the combustion rate distribution at 0.24 second.

Why is a delayed explosion battery ESS incident important?

One delayed explosion battery ESS incident is particularly noteworthy because the severe firefighter injuries and unusual circumstances in this incident were widely reported (Renewable Energy World, 2019).

Is a battery module overcharged in a real energy storage container?

The battery module of 8.8kWh is overcharged in a real energy storage container. The generation and explosion phenomenon of the combustible gases are analyzed. The numerical study on gas explosion of energy storage station are carried out. Lithium-ion battery is widely used in the field of energy storage currently.

What happened at McMicken energy storage unit?

This incident occurred at the Arizona Public Service (APS, 2019) McMicken Energy Storage Unit facility in Surprise, Arizona, 28 miles northwest of Phoenix. As shown in Fig. 3, the facility is adjacent to an APS substation. It is a 2 MW, 2 MWh facility with 27 racks, each containing 392 Li-ion Nickel-Manganese-Cobalt pouch cells (DNV GL, 2020).
