

In this contribution, a promising hybrid cell concept for polymer-based solid-state batteries is introduced in an effort to approach faster charge conditions and reduce the total thickness of cell components and resulting cell, ...

To enhance the cycling performance of all-solid-state polymer batteries at high voltages, it is desirable to seek a suitable all-solid-state polymer electrolyte design strategy, focusing on the interfacial ion transport properties ...

The use of a solid electrolyte allows fixing the solubility problem of organic electroactive materials in classical liquid electrolytes. This is the first time an all-solid-state organic battery based on TCNQ versus lithium metal is ...

All solid state battery polymer
