

# Average LFP battery system price per 1GW in Mexico

How much do LFP batteries cost?

With both the EV industry and stationary storage sectors increasingly adopting batteries with LFP cathode chemistry, LFP pack average prices were found to be US\$130/kWh and LFP cells at US\$95/kWh. LFP is now just less than 1/3 (32%) cheaper than NMC.

How much does a LFP cell cost?

The price of LFP cells is over 20% lower than nickel cobalt manganese (NCM) cells. The average price of an LFP cell was just under \$60/kWh in 2024. Currently, Greater China has a near monopoly in LFP cell manufacturing, considering the negligible LFP production capacity in Europe and North America.

Will LFP increase the global average price of LFP cells?

The addition of LFP capacities outside of Greater China will raise the global average price of LFP cells in the midterm, but as the manufacturing cost is brought under control through process improvements, the global LFP average cell price will gradually fall below the current level.

How much does an LFP cell cost in 2024?

The average price of an LFP cell was just under \$60/kWh in 2024. Currently, Greater China has a near monopoly in LFP cell manufacturing, considering the negligible LFP production capacity in Europe and North America. However, LFP production capacity is poised to expand, especially in Europe, through this decade.

Are battery storage costs based on long-term planning models?

Battery storage costs have evolved rapidly over the past several years, necessitating an update to storage cost projections used in long-term planning models and other activities. This work documents the development of these projections, which are based on recent publications of storage costs.

Why did lithium-ion battery prices drop 20% from 2023?

Lithium-ion battery pack prices dropped 20% from 2023 to a record low of \$115 per kilowatt-hour, according to analysis by research provider BloombergNEF (BNEF). Factors driving the decline include cell manufacturing overcapacity, economies of scale, low metal and component prices, adoption of lower-cost lithium-...

The cost and performance of the battery systems are based on an assumption of approximately one cycle per day. Therefore, a 4-hour device has an expected capacity factor of 16.7% ( $4/24 = 0.167$ ), and a 2-hour device has an expected ...
