

Blade battery vs solid state battery

Why do we need blade batteries?

Blade batteries cannot achieve higher energy density in battery materials, but they have made breakthroughs in battery system integration. This solves the shortcomings of short battery life of lithium iron phosphate batteries. This is the background for the birth of blade batteries. Part 3. BYD blade battery specifications Part 4.

What are the advantages and disadvantages of blade batteries?

Another advantage of blade batteries is that they have good heat dissipation performance. We all know that batteries are particularly sensitive to temperature, which is also the main reason that limits battery fast charging time. Therefore, heat dissipation is a very important indicator for battery cells.

What is a blade battery?

The Blade Battery is a type of lithium-ion battery developed by BYD, a Chinese automobile manufacturer. It features a unique design that aims to improve safety and energy density compared to conventional lithium-ion batteries. While I do not detail the Blade Battery as well, stages: Constant Current (CC) Charging and Constant Voltage (CV) Charging.

How safe is a blade battery?

Unlike conventional lithium-ion batteries, the Blade Battery has undergone rigorous nail penetration tests, a benchmark for battery safety. According to BYD, the Blade Battery remains cool under pressure, significantly reducing the risk of thermal runaway, a common issue in traditional batteries that can lead to fires.

Why is a blade battery better than a battery core?

Because the blade battery has a larger heat dissipation surface and a thin thickness, the blade battery core has better heat dissipation performance. From the data released by BYD's blade battery patent, we can see the temperature simulation results of battery cells with different thicknesses inside the blade battery.

Are BYD blade batteries safe?

While BYD's Blade batteries lose out in cooling, they are also likely the safest among its peers. This is because the BYD Blade battery uses iron-based cells, which have a higher decomposition and lower heat release temperature than the nickel-based cells used in Tesla's 4680 cells and CATL's nickel-based Qilin batteries.

Blade Battery. Source: BYD There is also an updated version of this LFP blade battery that will take that up to 190 Wh/kg, but it is still less than half of the energy density of the solid-state cells. Earlier this year, BYD shook ...
