

Where can I find performance and testing protocols for stationary energy storage systems?

The United States has several sources for performance and testing protocols on stationary energy storage systems. This research focuses on the protocols established by National Labs (Sandia National Laboratories and PNNL being two key labs in this area) and the Institute of Electrical and Electronics Engineers (IEEE).

Can a stationary energy storage system adapt to other energy storage systems?

In regions where there is an absence of extensive or relevant protocols for stationary energy storage systems, there may be the ability to adapt or expand on protocols for other energy storage systems that are available.

What are some useful reports about energy storage testing?

Below is a non-exhaustive list of valuable reports that the working group has relied on when becoming familiar with storage testing. "Electric energy storage - future storage demand" by International Energy Agency (IEA) Annex ECES 26, 2015, C. Doetsch, B. Droste-Franke, G. Mulder, Y. Scholz, M. Perrin.

What are the different types of battery energy storage systems?

There are four main energy storage systems that are addressed in this research: lead-acid, lithium-ion, sodium-sulfur, and flow batteries. Review of global market reports indicates that lead-acid and lithium-ion were the primary battery energy storage systems used, each has its own advantages and disadvantages.
