

Can solar batteries charge using florescent light

Can artificial lights charge a solar cell?

While artificial lights are capable of powering solar cells, these kinds of light can never charge a solar cell as efficiently as direct sunlight can. There are a variety of reasons for this phenomenon:

Are incandescent lights good for charging solar cells?

Incandescent lights: Incandescent lights feature a wire filament (typically tungsten) housed in a bulb. Not only are incandescent lights poor choices for charging solar cells, they are generally the least efficient energy option out of all modern-day electrical lights.

Can a battery be charged in direct sunlight?

But it will not be nearly as efficient as charging the cell in direct sunlight. What light can be converted to electrical energy is dictated by a certain range of wavelengths of light, which are present in both direct sunlight and artificial light. Therefore, the battery can be charged from either source of light.

How do you charge a solar cell?

If you're trying to charge solar cells, the best thing to do is put them out in the sunlight. Even indirect sunlight will charge a traditional PV solar cell faster than any source of artificial light ever could, and you'd be expending more energy to power the artificial light than you'd collect.

Can light be used to power a solar cell?

If light is strong enough to be visible, that means it is strong enough to power a solar cell. Any artificial light, from fluorescent ballasts to incandescent bulbs, can give off some kind of light that is able to be absorbed and used by solar cells. However, there are two caveats to this fact:

Do solar cells convert infrared light into energy?

Solar cells are able to convert roughly half of the infrared light they absorb into energy, and a portion of the ultraviolet light (but not much of it, making UV lights some of the least efficient lights to charge a solar light with).

Using solar power can help reduce your environmental impact and cut down electric bills. Solar cells transform light, including artificial sources, into electricity. While solar panels can technically charge with light from sources like ...

Fluorescent lights also rely on interesting physics to produce visible light. Within the bulb, an electric current excites mercury vapor, which then emits ultraviolet light. This UV light is invisible but causes a phosphor coating ...
