

# Common steel materials used in compressed air energy storage projects

What is compressed air energy storage (CAES)?

Among the different ES technologies, compressed air energy storage (CAES) can store tens to hundreds of MW of power capacity for long-term applications and utility-scale. The increasing need for large-scale ES has led to the rising interest and development of CAES projects.

What are the main components of a compressed air system?

The largest component in such systems is the storage medium for the compressed air. This means that higher pressure storage enables reduced volume and higher energy density.

What types of energy storage applications are available?

For enormous scale power and highly energetic storage applications, such as bulk energy, auxiliary, and transmission infrastructure services, pumped hydro storage and compressed air energy storage are currently suitable.

How CAES uses compressed and pressured air to store energy?

CAES uses compressed and pressured air to store energy. Compressor, underground storage unit, and turbine, are the main CAES components. The air is compressed and stored at a high pressure in an underground chamber and when needed, it expanded. The air is compressed while off peak and this stored energy is used during peak time.

Which energy storage technology is suitable for large scale energy storage?

In addition to widespread pumped hydroelectric energy storage (PHS), compressed air energy storage (CAES) is another suitable technology for large scale and long duration energy storage. India is projected to become the most populous country by the mid-2020s.

What types of energy storage systems are available?

Various energy storage systems are available, including pumped hydro, battery energy storage, flywheel energy storage, thermal energy storage, hydrogen energy storage, supercapacitor energy storage, compressed natural gas (CNG) storage, and mechanical energy storage. Let's compare CAES with some of these systems.
