

Connect solar panel to battery space engineers

Does a solar power plant need a battery?

It does not require any materials to be powered, and does come with a small initial charge but beyond this it must collect energy either from Solar panels, Large Reactors, and/or Small Reactors before it can be put to use (or even other batteries).

Do solar panels need to be connected to a power grid?

No "cables" are needed to convey power. Just connect the Solar Panels with any blocks. The power grid gives priority to drawing solar power, therefore any reactors on the same ship or station can remain active and will only consume uranium once the power draw exceeds the capacity of both the solar panels and the discharging Batteries.

Can a solar panel be used on a ship?

The power grid gives priority to use of solar power, therefore any reactors on the same ship or station can remain active, but will only consume uranium once the power draw exceeds the capacity of both the solar panels and the discharging Batteries. A Solar Panel attached to a large ship produces a maximum of 160 kW when aimed directly at the sun.

Is it a bug if a solar power station doesn't work?

I just realised that it is in fact a bug. If you let the batteries in no mode, half the energy produced by the solar panels is wasted but if you set them to recharge, and the power need of the station is higher than what the solar panels produce, the station will still work and suck no power from the batteries, FREE POWER.

Do solar panels consume uranium?

Just connect the Solar Panels with any blocks. The power grid gives priority to drawing solar power, therefore any reactors on the same ship or station can remain active and will only consume uranium once the power draw exceeds the capacity of both the solar panels and the discharging Batteries. What influences efficiency?

Should a battery take priority over a reactor or a solar panel?

Once a battery has enough charge in it it may be set to only discharge its stored power into the grid, the battery should take priority over reactors (using fuel) but not active solar panels - this may vary due to subgrids and etc.
