

Energy storage explosion-proof battery

Do lithium-ion batteries cause explosions?

Lithium-ion batteries are widely used in the field of energy storage. However, the combustible gases generated during thermal runaway events of batteries may lead to explosion. The latest NFPA 855-2023 requires that lithium-ion energy storage stations (Li-BESS) larger than 20 kWh must install explosion protection devices.

Can a lithium ion battery cause a gas explosion in energy storage station?

The numerical study on gas explosion of energy storage station are carried out. Lithium-ion battery is widely used in the field of energy storage currently. However, the combustible gases produced by the batteries during thermal runaway process may lead to explosions in energy storage station.

Why are batteries prone to fires & explosions?

Some of these batteries have experienced troubling fires and explosions. There have been two types of explosions; flammable gas explosions due to gases generated in battery thermal runaways, and electrical arc explosions leading to structural failure of battery electrical enclosures.

Why are explosion hazards a concern for ESS batteries?

For grid-scale and residential applications of ESS, explosion hazards are a significant concern due to the propensity of lithium-ion batteries to undergo thermal runaway, which causes a release of flammable gases composed of hydrogen, hydrocarbons (e.g. methane, ethylene, etc.), carbon monoxide, and carbon dioxide.

What causes a battery enclosure to explode?

The large explosion incidents, in which battery system enclosures are damaged, are due to the deflagration of accumulated flammable gases generated during cell thermal runaways within one or more modules. Smaller explosions are often due to energetic arc flashes within modules or rack electrical protection enclosures.

What causes large-scale lithium-ion energy storage battery fires?

Several large-scale lithium-ion energy storage battery fire incidents have involved explosions. The large explosion incidents, in which battery system enclosures are damaged, are due to the deflagration of accumulated flammable gases generated during cell thermal runaways within one or more modules.
