

Energy storage peaks and valleys

Do energy storage systems achieve the expected peak-shaving and valley-filling effect?

Abstract: In order to make the energy storage system achieve the expected peak-shaving and valley-filling effect, an energy-storage peak-shaving scheduling strategy considering the improvement goal of peak-valley difference is proposed.

Which energy storage technologies reduce peak-to-Valley difference after peak-shaving and valley-filling?

The model aims to minimize the load peak-to-valley difference after peak-shaving and valley-filling. We consider six existing mainstream energy storage technologies: pumped hydro storage (PHS), compressed air energy storage (CAES), super-capacitors (SC), lithium-ion batteries, lead-acid batteries, and vanadium redox flow batteries (VRB).

How can energy storage reduce load peak-to-Valley difference?

Therefore, minimizing the load peak-to-valley difference after energy storage, peak-shaving, and valley-filling can utilize the role of energy storage in load smoothing and obtain an optimal configuration under a high-quality power supply that is in line with real-world scenarios.

What is the peak-to-Valley difference after optimal energy storage?

The load peak-to-valley difference after optimal energy storage is between 5.3 billion kW and 10.4 billion kW. A significant contradiction exists between the two goals of minimum cost and minimum load peak-to-valley difference. In other words, one objective cannot be improved without compromising another.

Can NLMOP reduce load peak-to-Valley difference after energy storage peak shaving?

Minimizing the load peak-to-valley difference after energy storage peak shaving and valley-filling is an objective of the NLMOP model, and it meets the stability requirements of the power system. The model can overcome the shortcomings of the existing research that focuses on the economic goals of configuration and hourly scheduling.

What is the optimal energy storage capacity?

The optimal energy storage capacities were 729 kWh and 650 kWh under the two scenarios with and without demand response, respectively. It is essential for energy storage to smoothen the load curve of a power system and improve its stability.
