

Expected ROI of backup power battery project in Panama 2030

Will lithium-ion batteries become more expensive in 2030?

According to some projections, by 2030, the cost of lithium-ion batteries could decrease by an additional 30-40%, driven by technological advancements and increased production. This trend is expected to open up new markets and applications for battery storage, further driving economic viability.

Are battery storage projects financially viable?

Different countries have various schemes, like feed-in tariffs or grants, which can significantly impact the financial viability of battery storage projects. Market trends indicate a continuing decrease in the cost of battery storage, making it an increasingly viable option for both grid and off-grid applications.

How do government incentives and subsidies affect battery storage?

Government incentives and subsidies play a significant role in the economics of battery storage. In the United States, the investment tax credit (ITC), which offers a tax credit for solar energy systems, has been extended to include battery storage when installed in conjunction with solar panels.

How much energy does Panama need?

Panama expects total energy demand to more than double between 2017 and 2030 (+113%), with peak demand growing from 1.6 GW to 3.5 GW. Panama is currently connected to Costa Rica via a 300 MW transmission line. A 400 MW high-voltage direct current (HVDC) interconnector with Colombia is expected to be commissioned by 2022.

What will ETESA's energy plan look like in 2030?

ETESA's 2018 energy plan (2018b) considers two scenarios for 2030. In the reference scenario, the wind and solar installed capacities remain the same as in 2017, but an additional 2 gigawatts (GW) of natural gas-fired generation is installed.

Where P_B = battery power capacity (kW), E_B = battery energy storage capacity (\$/kWh), and c_i = constants specific to each future year. Capital Expenditures (CAPEX) Definition: The bottom-up cost model documented by (Ramasamy et ...
