

# Future development direction planning of energy storage

Are there future opportunities for storage within the electricity sector?

In this study, we limit our focus to future opportunities for storage within the electricity sector. That is, we include only storage that takes in electrical energy, stores that energy in a variety of forms, and then returns the stored energy to the electricity system as electricity.

What is the energy storage strategy & roadmap (SRM)?

WASHINGTON, D.C. - The U.S. Department of Energy (DOE) today released its draft Energy Storage Strategy and Roadmap (SRM), a plan that provides strategic direction and identifies key opportunities to optimize DOE's investment in future planning of energy storage research, development, demonstration, and deployment projects.

Why was the energy storage roadmap updated in 2022?

The Energy Storage Roadmap was reviewed and updated in 2022 to refine the envisioned future states and provide more comprehensive assessments and descriptions of the progress needed (i.e., gaps) to achieve the desired 2025 vision.

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

What is the implementation plan for the development of new energy storage?

In January 2022, the National Development and Reform Commission and the National Energy Administration jointly issued the Implementation Plan for the Development of New Energy Storage during the 14th Five-Year Plan Period, emphasizing the fundamental role of new energy storage technologies in a new power system.

What is the future of energy storage integration?

166MIT Study on the Future of Energy Storage integration, by contrast, are expected to account for only a very small share (approximately 0.5%) of hydrogen demand. Increased demand for "green" hydrogen will drive down the cost of green hydrogen production technologies, eventually making power generation via hydrogen more cost competitive.
