

High storage modulus indicates

What happens if loss modulus is higher than storage modulus?

If it is higher than the loss modulus the material can be regarded as mainly elastic, i.e. the phase shift is below 45° . Higher storage modulus means higher energy storage capability of the material. Material flow recovery will be more than a smaller storage modulus value towards their original state after removing the applied force.

What is a storage modulus?

The storage modulus is a measure of how much energy must be put into the sample in order to distort it. The difference between the loading and unloading curves is called the loss modulus, E'' . It measures energy lost during that cycling strain. Why would energy be lost in this experiment? In a polymer, it has to do chiefly with chain flow.

What is the difference between tensile modulus and storage modulus?

Higher storage modulus means higher energy storage capability of the material. Material flow recovery will be more than a smaller storage modulus value towards their original state after removing the applied force. Young's modulus is referred to as tensile modulus, which is totally different material property other than the storage modulus.

What does loss modulus mean?

It represents the energy stored in the elastic structure of the sample. If it is higher than the loss modulus the material can be regarded as mainly elastic, i.e. the phase shift is below 45° . Higher storage modulus means higher energy storage capability of the material.

What is a storage modulus in a nozzle extruder?

The storage modulus determines the solid-like character of a polymer. When the storage modulus is high, the more difficult it is to break down the polymer, which makes it more difficult to force through a nozzle extruder. Therefore, the nozzle can become clogged and the polymer cannot pass through the opening.

Does a higher storage modulus mean less swelling?

Higher storage modulus means less swelling (assuming you're comparing hydrogels of the same type with different degrees of swelling). If you observe a decrease in the storage modulus with increasing temperature, it is most probably a result of non-chemical/covalent cross-links weakening.

High storage modulus indicates
