

What re technologies are available in Libya?

Existing utilization state and predicted development potential of various RE technologies in Libya, including solar energy, wind (onshore & offshore), biomass, wave and geothermal energy, are thoroughly investigated.

What is the potential of solar PV & onshore wind in Libya?

The average potential of solar PV and onshore wind over the Libyan territories amounts to 1.9 MWh/kW/year and 400 W/m, respectively. Notwithstanding, biomass and geothermal energy sources are likely to play an important complementary role in this regard.

Can large-scale PV projects be implemented in Libya?

There have been few works in literature for the assessment of large-scale PV projects in Libya. The potential of installing a 50 MW PV power plant at Al Kufra was evaluated in Ref. [1]. The study indicated that the proposed PV plant can generate 114 GWh and reduce 76 ktCO₂ pollution per annum.

Can a rational use of energy save energy in Libya?

It has been estimated that the rational use of energy in Libya through utilizing more efficient appliances and lighting combined with improved behavior and energy management initiatives can save up to 2000 MW of installed capacity equivalent to burning 50 M barrels of oil [161].

What percentage of Libya's electricity comes from natural gas?

Natural gas represents about 63% of the Libyan electricity as presented in [1]. Approximately 29% of Libya's electrical power is generated from oil-fired plants, while the remaining comes from non-fuel combined steam power plants.

How is energy used in Libya?

Total energy supply (TES) includes all the energy produced in or imported to a country, minus that which is exported or stored. It represents all the energy required to supply end users in the country.
