

Is energy storage a viable solution for the Finnish energy system?

This development forebodes a significant transition in the Finnish energy system, requiring new flexibility mechanisms to cope with this large share of generation from variable renewable energy sources. Energy storage is one solution that can provide this flexibility and is therefore expected to grow.

Are high Vres shares possible in the Finnish energy system?

In conclusion, these studies indicate that high VRES shares in the Finnish energy system are possible, but require measures such as energy storage and demand response for their successful integration. 3.

Can ESSs solve intermittent power production in Finland?

The growth of wind deployments influences both the electricity system and the electricity markets. ESSs are one main solution to tackle intermittent power production, but in Finland, there are so many wind projects in the pipeline that ESSs alone cannot solve this issue.

What is the electricity supply in Finland in 2022?

The electricity supply in Finland is quite diverse. As presented in Fig. 1, the Finnish electricity supply in 2022 consisted of nuclear power (29.7 %, 24.2 TWh), different types of thermal power plants (24 %, 19.6 TWh), imports (15.3 %, 12.5 TWh), hydropower (16.3 %, 13.3 TWh), wind power (14.2 %, 11.6 TWh), and solar power (0.5 %, 0.4 TWh).

Photovoltaic ESS supplier quotation in Finland 2030
