

What is a CSP plant with thermal energy storage?

CSP plant with thermal energy storage. The CSP has power capacity between 10 kW (for small applications) to 200 MW (for grid connection applications). When CSP plant is equipped with thermal storage this is considered as a long-term energy storage method because it can store energy for several hours.

What are the characteristics of all energy storage methods?

Table 1 and Table 2 contain the characteristics of all storage methods. A comparison of all energy storage technologies by their power rating, autonomy at rated power, energy and power density, lifetime in cycles and years, energy efficiency, maximum DoD (permitted), response time, capital cost, self-discharge rate and maturity is presented.

Is PHS a large-scale energy storage?

PHS is considered as a large-scale energy storage. The first large-scale station for PHS was built in 1929, in Hartford, USA. Currently there are globally over 300 PHS plants with a total installed capacity of 169 GW. The largest PHS plant has a capacity of 3 GW and duration of 10 h at rated power.

Who is Sophia Haussener?

Sophia Haussener is an Associate Professor heading the Laboratory of Renewable Energy Science and Engineering at the Ecole Polytechnique Fédérale de Lausanne (EPFL). Her current research is focused on providing design guidelines for thermal, thermochemical, and photoelectrochemical energy conversion reactors through multi-physics modeling.

How do energy storage technologies compare?

Furthermore, Section 3 compares all energy storage technologies by their energy and power density, lifetime in cycles and years, energy efficiency, response time, capital cost, self-discharge rate and maturity. A brief comparison is given by the form of tables. In Section 4, a discussion of the grid scale energy storage applications is presented.

How to choose the best energy storage method?

The choice of the ideal storage method to be used depends on several factors: the amount of energy or power to be stored (small-scale or large-scale), the time for which this stored energy is required to be retained or to be released (short-term or long-term), spacing, portability, environmental issues, energy efficiency, cost, and so forth.
