

Swedish vanadium liquid flow energy storage project

What is vanadium flow storage technology?

Vanadium flow storage technology uses the flow of vanadium electrolyte across an ion exchange membrane. The advantages of this type of storage are safety, scalability and long-term operation. Vanadium electrolyte used in this battery is non-flammable and the battery operates at room temperature.

What is a vanadium flow battery (VFB)?

Our innovative vanadium flow batteries (VFBs) are designed to provide reliable, long-lasting energy storage for a greener tomorrow. Accelerating global progress towards net-zero targets with advanced vanadium flow battery (VFB) energy storage solutions. Water-based electrolyte, no thermal runaway

Are vanadium redox flow batteries a viable energy storage option?

With a plethora of available BESS technologies, vanadium redox flow batteries (VRFB) are a promising energy storage candidate. However, the main drawback for VRFB is the low power per area of the cell. In this project we will address the mechanism of VRFB operation at both molecular and device levels.

Can vanadium electrolyte be recycled?

In parallel, vanadium electrolyte can be 100% recycled. Existing VRFB still have a low energy density. Our collaborative project is focused on this problem. The rate capabilities of VRFB are limited by the slow kinetics of polysulfate reaction because of its complex mechanism.

Are VRFBs a promising energy storage candidate?

With a plethora of available BESS technologies, VRFBs are widely considered a promising energy storage candidate. The uniqueness of VRFB is the possibility to set independently the power of the battery by the size of the device and the energy for the battery by the size of the tank for liquid reagents.
