

The energy storage industry has arrived

Why is the energy storage sector growing?

The energy storage sector has seen remarkable growth in recent times due to the demand and supply in technology that drives clean energy solutions.

What is the future of energy storage?

Global installed energy storage is on a steep upward trajectory. From just under 0.5 terawatts (TW) in 2024, total capacity is expected to rise ninefold to over 4 TW by 2040, driven by battery energy storage systems (BESS). Last year saw a record-breaking 200 gigawatt-hours (GWh) of new BESS projects coming online, a growth rate of 80%.

Is China entering a new era of energy storage demand?

Mainland China accounts for most of the global energy storage demand, driven in the near term by regional requirements for new utility-scale wind and solar projects to include energy storage capacity. However, the Chinese market is entering an era of change.

What will energy storage be like in 2024?

In 2024, the global energy storage is set to add more than 100 gigawatt-hours of capacity for the first time. The uptick will be largely driven by the growth in China, which will once again be the largest energy storage market globally.

Is China's energy storage industry in a crisis?

Despite this rapid growth, China's energy storage industry is still in its infancy, and a crisis has arrived much earlier than expected. A persisting price war and overcapacity weigh on profits. Back in 2021 and 2022, battery supply was the biggest bottleneck for the energy storage supply chain.

Should energy storage be developed?

Developing energy storage has become a global consensus. It was announced at COP29 in late 2024 that global storage capacity will increase to 1,500 GW by 2030, more than six times the 2022 level. As a result, InfoLink maintains a cautiously optimistic outlook for the medium- to long-term development of energy storage systems.
